

Living Arrangements of Fathers and Their Children

Karen Benjamin Guzzo & Krista K. Payne

Recent research has documented the complex living arrangements of today's children (FP-13-19), but less is known about the living arrangements of parents, particularly fathers. Because mothers are far more likely to have full-time physical custody of their children in non-intact families, many fathers do not live with their children. However, until recently, the research community lacked data that identified the living arrangements for all of men's children. This profile uses the 2006-2010 National Survey of Family Growth (NSFG), one of the few data sources that collects information directly from men aged 15-44 about their children, to provide a contemporary snapshot of whether fathers with only minor children live with all of their children. For each child, fathers directly reported whether they live with their child all or some of the time; these reports do not incorporate visitation unless it occurs frequently enough for a father to consider his child(ren) actually living with him at least part-time.

Paternal Coresidence with Minor Children

Figure 1. Fathers' Living Arrangements with Their Minor Children

Source: NSFG 2006-2010

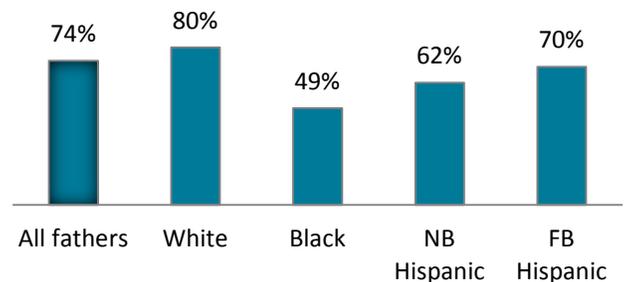

- Figure 1 illustrates 74% of fathers live with all of their minor children at least some of the time—this is in contrast to 93% of mothers (not shown).
- Among fathers living with all of their children, about 70% are living with all of their children on a full-time basis.
- Very few fathers (about 5%) report living with some or all of their children part-time.
- Of the 26% who do not live with all of their minor children, about 30% are living with at least one child (not shown).

Fathers Living with All of Their Children

Race, Ethnicity, & Nativity

- White fathers are the most likely to report living with all of their minor children (80%) followed by foreign-born (FB) Hispanic fathers (70%).
- Half (49%) of Black fathers report living with all of their children.

Educational Attainment

- As father's educational attainment increases, the share of fathers living with all of their minor children also rises.
 - Fathers who have not earned a high school diploma are the least likely to be living with all of their children (60%), whereas over 90% of fathers with at least a Bachelor's degree do so.

Family Profiles examine topics related to NCFMR's core research themes. Data are presented at both the national and state levels using new data sources. Written for both researchers and broad communities, these profiles summarize the latest statistics on U.S. families.

Age at First Birth

- Men who become fathers at older ages are more likely to report living with all of their minor children.
 - Less than half of fathers who were teenagers at the time of first birth are living with all of their children.
 - Among fathers ages 25-29 at the time of first birth—the age range in which the average father's first child is born—83% live with all of their children.
 - Over 90% of older (over age 30) first-time fathers are living with all of their children.

Current Marital Status

- Fathers in a first marriage are by far the most likely to be living with all of their minor children at 91%.
- Similar proportions of men in remarriages (married 2 or more times) and never married men are living with all of their children, at 55% and 53%, respectively.
- Less than half of men who are not married and are divorced or widowed are living with all of their children.
